

# Service Architecture Overview

-Defines Business Use Cases, as well as provides necessary contracts for other layers as necessary (dataprovers..etc)  
- responsible for concrete implementation of data storage/retrieval mechanisms (database, network ...etc)

Domain (Core)

Application Entry points (REST, CLI, gRPC..etc)

Application Configurations  
- What wires all layers together (config/ in symfony)

Notes: (following concepts from Clean Architecture)

Each layer is unaware of the layers underneath it

Each layer is dependent on the layers above it
